[RISOLTO] UBUNTU problema installazione TEAMVIEWER “wrong architecture i386”

On newer 64-bit DEB-systems with Multiarch-support (Debian 7) **teamviewer_linux_x64.deb** cannot be installed because the package ia32-libs is not available anymore on these systems. In this case you can use [teamviewer_linux.deb](#) instead.

SCARICARE QUESTO : http://download.teamviewer.com/download/teamviewer_linux.deb

cd Scaricati/

sudo dpkg -i **teamviewer_linux.deb**

se ci sono problemi dare i due comandi sotto e far girare di nuovo quello sopra

In case you get the error “wrong architecture i386” you have to execute the following command lines as an administrator:

- dpkg --add-architecture i386
- apt-get update
